August 1, 2014

Background

The Residential Energy Services Network (RESNET) contracted the Florida Solar Energy Center (FSEC) to conduct cost effectiveness analysis of new homes configured to comply with the Energy Rating Index (ERI) compliance provisions of the 2015 International Energy Conservation Code (IECC). The ERI compliance provisions of the 2015 IECC resulted from acceptance of code proposal RE 188-13. Simulation analysis of homes configured to comply with the 2012 IECC were used as the basis for the analysis and compared against homes meeting the ERI thresholds of the 2015 IECC for typical residences across representative U.S. climates. EnergyGauge[®] USA (v.3.1.02), a RESNET-accredited HERS software tool, was used to conduct the simulation analysis.

This study relies on previous simulation and analysis works used in the development of the ERI compliance values that were adopted by the 2015 IECC (Fairey 2013). This work extends the earlier work to include a set of cost effectiveness analysis of 2015 IECC compliance using the 2012 IECC *Standard Reference Design* as the basis of comparison and the HERS Index as the measure of ERI compliance.

Abstract

The EnergyGauge HERS software tool is used to examine the 2012 IECC *Standard Reference Design* (IECC SRD) configuration for three-bedroom, one-story 2000 ft² and three-bedroom, two-story 2,400 ft² single-family homes in sixteen representative U.S. cities. The energy use of the 2012 SRD homes is compared against the energy use of homes complying with the 2015 IECC using the ERI compliance method.

HERS simulations for each home are conducted for both a *best case* home orientation and a *worst case* home orientation. Improvements to the 2012 IECC SRD homes are made such that the HERS Index for the homes are at or below the ERI compliance scores prescribed by the 2015 IECC. The incremental improvement costs are estimated as the difference in cost between the SRD measure costs and the measure costs for the 2015 ERI compliant homes. Economic cost effectiveness calculations are performed in accordance with Section 4.6, ANSI/RESNET 301-2014.

The analysis show that the 2015 IECC ERI scores are cost effective in all of the 16 cities for all of the homes under all of the conditions studied. On a national basis, the climate

zone weighted average net present value (present value life-cycle savings minus present value life-cycle improvement costs) for the cohort of homes is \$5,219. This is significant considering the fact that the weighted average first cost of making the energy efficiency improvements is \$3,338.

Methodology

One-story, 2000 ft², 3-bedroom frame homes and two-story, 2400 ft², 3-bedroom frame homes were configured to simulate the 2012 IECC *Standard Reference Design* in sixteen representative cities across the eight IECC climate regions of the United States. Windows were configured such that 35% of the total window area was located on the front and rear faces of the home and 15% was located on the side faces. This allowed the simulations to examine a *best-case* orientation scenario with the front of the homes also had a 20-foot adjoining garage wall. The foundation for the homes was varied by IECC climate zone with slab-on-grade foundations in zones 1 through 4 and with unconditioned basement foundations in zones 5 through 8.

Tables 1 through 5 present the 2012 IECC characteristics for the 64 different home configurations used as the baseline in the simulation analysis.

| Component | 1-story | 2-Story |
|---|---------|---------|
| 1st floor area (ft ²) | 2,000 | 1,200 |
| 2nd floor area (ft ²) | 0 | 1,200 |
| Total above grade floor area (ft ²) | 2,000 | 2,400 |
| Total above grade volume (ft ³) | 18,000 | 21,000 |
| N-S wall length (ft) | 50 | 40 |
| E-W wall length (ft) | 40 | 30 |
| 1st floor wall height (ft) | 9 | 8 |
| Height between floors (ft) | 0 | 1.5 |
| 2nd floor wall height (ft) | 0 | 8 |
| Door area (ft^2) | 40 | 40 |
| Window/floor area ratio (%) | 15% | 15% |
| Total window area (ft ²) | 300 | 360 |
| N-S window fraction (%) | 35% | 35% |
| E-W window fraction (%) | 15% | 15% |

Table 3: Additional 2012 IECC

Standard Reference Design Characteristics

| Item | 2012 IECC |
|--|-----------------|
| Envelope Leakage | CZ 1-2: 5 ach50 |
| Elivelope Leakage | CZ 3-8: 3 ach50 |
| Air Distribution System Efficiency | See Table 4 |
| Programmable Thermostat | Yes |
| High Efficiency Lighting | 75% |
| Hot Water Pipe Insulation | Yes |
| Mechanical Ventilation (per 2012 IMC) | CZ 1-2: None |
| Wiechanical Ventilation (per 2012 INC) | CZ 3-8: 60 cfm |
| Sealed Air Handlers | Yes |

Table 4: Air Distribution Systems (ADS) for 2012 Standard Reference Designs

| Foundation Type | ADS location | Duct R-value | Duct leakage |
|-----------------|--------------|--------------|-----------------------------|
| Slab on grade | Attic | 8 | 4 cfm25/100 ft ² |
| Basement | Basement | 6 | 4 cfm25/100 ft2 |

Base thermostat set point temperatures for all simulations were maintained at the IECC 2006 values of 78 °F for cooling and 68 °F for heating. While the 2009 IECC and 2012 IECC use 75 F for cooling and 72 F for heating, use of these base thermostat set points for HERS Index compliance would not allow comparison.

| Zone 5 | 55 |
| Zone 6 | 54 |
| Zone 7 | 53 |
| Zone 8 | 53 |

Table 6: 2015 IECC Criteria

Martin (2014) reports that the RESNET National Building Registry contains 270,580 registered HERS ratings. Of these, 33,426 or 12.4% comply with the 2015 IECC ERI compliance criteria given in Table 6.

The most common efficiency improvements employed in the study comprised 100% high-efficiency lighting; higher efficiency heating, cooling and water heating equipment; interior, leak-free duct systems; enhanced envelope efficiencies; and energy star refrigerators, dishwashers and clothes washers.

Improvement Costs

Incremental cost of improving the 2012 IECC SRD prototypes to comply with the ERI compliance criteria of the 2015 IECC are determined using the methodology used to evaluate the cost effectiveness of retrofits for the Building America program (Fairey and Parker 2012). In most cases, improvement costs used in the investigation parallel those available from the National Renewable Energy Laboratory's (NREL) National Residential Efficiency Measure Database.¹

For heating and air conditioning equipment costs, Fairey and Parker (2012) relied on a separate methodology whereby the costs are expressed in an equation as a function of the equipment capacity and efficiency along with an offset, derived using available retail data and estimated fixed costs. The data and analysis that underlie these heating and cooling equipment cost equations are presented in Appendix B of Fairey and Parker (2012). For certain other costs, the NREL cost data were reduced to equations based on component areas and incremental improvement changes. For example, examination of the NREL data on fibrous insulation reveals that the cost of fibrous insulation is approximately

¹ www.nrel.gov/ap/retrofits/index.cfm

 $0.035/\text{ft}^2$ per R-value. For these types of improvements these costs were cast in such terms. For most other costs, the costs contained in the NREL database were adopted.

For ENERGY STAR appliance costs, representative pricing from the internet is used to determine incremental costs. However, this is difficult because most new appliances are now ENERGY STAR compliant and it is often difficult to find appliances with similar features that are not rated as ENERGY STAR.

Attic radiant barrier systems (RBS) were employed to enhance efficiency in a number of the cooling dominated and mixed climate homes. The cost of the RBS is determined as \$0.25 per square foot of roof area. For each of the improved homes, the forced air distribution systems is brought into the conditioned space and tested to be leak free. The cost of this improvement is taken as \$0.50 per square foot of conditioned floor area.

For HVAC equipment, the following equations are used to calculate installed retrofit costs (see Appendix B of Fairey and Parker 2012 for derivations).

- Heat pumps: -5539 + 604*SEER + 699*tons
- Air conditioners (with strip heat): -1409 + 292*SEER + 520*tons
- Gas furnace/air conditioner: -6067 + 568*SEER + 517*tons + 4.04*kBtu + 1468*AFUE
- Gas furnace only: -3936 + 14.95*kBtu + 5865*AFUE

where:

tons = air conditioning capacity, which is limited to a minimum value of 1.5 tons kBtu = gas furnace capacity, which is limited to a minimum value of 45 kBtu

The estimating equations are valid for heat pump and cooling system sizes of 1.5–5 tons and multiples thereof. Similarly, the costs of gas heating equipment are based on heating capacities of 40–120 kBtu/h.

For envelope measures, incremental costs are determined as the difference between the measure cost for the 2012 IECC component and the measure cost of the improved component. For example, if the ceiling insulation level requirement in the 2012 IECC home is R-30 and it is increased to R-38 in the improved home, the incremental cost would be the R-value difference (8) times \$0.035/R per square foot of ceiling area.

For heating, cooling and hot water equipment, the basis for determining the cost difference is slightly different. In these cases, the cost of the 2015 NAECA minimum equipment are used as the baseline cost from which incremental costs are determined. When the 2015 IECC becomes effective, the NEACA standards will require the minimum heating, cooling and hot water equipment efficiencies to increase somewhat. Since these will be the new equipment baseline for the 2015 IECC, they are used as the basis for the incremental cost calculations in this study. These 2015 NAECA equipment standards are given in Table 7.

Economic Analysis

Economic analysis is based on a 30-year life-cycle-cost analysis using the methodology specified by Section 4.6, ANSI/RESNET 301-2014, which is based on the P1, P2 method of determining present worth values derived by Duffie and Beckman (1980). The equations used to determine P1 and P2 are given in Appendix A. The economic parameter values published on the RESNET web site for 2014² as augmented by an effective income tax rate of 25%, a property tax rate of 4% and a property assessment ratio of 80% were used in the analysis. These economic parameter values are given in Table 8.

| | values |
|---------------------------------|--------|
| General Inflation Rate (GR) | 2.53% |
| Discount Rate (DR) | 4.53% |
| Mortgage Interest Rate (MR) | 5.42% |
| Down payment Rate (DnPmt) | 10.00% |
| Energy Inflation Rate (ER) | 4.18% |
| Effective Income Tax Rate (iTR) | 25.0% |
| Property Tax Rate (pTR) | 4.0% |
| Assessment/Appraisal Ratio | 80% |

Table 8: Economic Parameter Values

The life-cycle-cost analysis includes replacement costs (escalated at the general inflation rate) for measures lasting less than the full analysis period (standard residential mortgage period of 30 years in this case). For example, HVAC equipment, with an assumed service life of 15 years, would be replaced in year 16 and high efficiency CFL lighting, with an assumed service life of 5 years, would be replaced five times during the analysis period. Where incremental maintenance is required, a maintenance fraction is also included in the analysis.

Energy prices used in the analysis are the most recently published (2012) average annual U.S. prices for residential electricity and residential natural gas as provided by the U.S.

² <u>http://www.resnet.us/professional/standards/mortgage</u>

Energy Information Administration.³ The prices used are \$0.1177/kWh of electricity consumption and \$1.045/therm of natural gas consumption. Energy prices are not varied in the analysis by location.

Findings

For the purposes of this study 'cost effective' is defined as the case in which the present value of the life-cycle energy cost reductions (the savings) exceeds the present value of the life-cycle improvement costs (the investment). The ratio of these two present values (Savings / Investment) is referred to as the savings-to-investment ratio or SIR. If the SIR is greater than unity, there is a net financial benefit derived from making the investment. The net present value (NPV) of the improvements is also calculated, where NPV equals the present value of the life-cycle energy cost reductions minus the present value of the life-cycle improvement costs.

The study finds that in all 64 cases, compliance with the ERI criteria of the 2015 IECC is cost-effective, including homes in *worst case* configurations. The detailed data for each home in each of the 16 TMY cities evaluated are given in Appendix B. The four set of results (1-story, 2-story, *best-case*, and *worst-case*) are averaged to determine the average data for each of the 16 TMY cities evaluated. The average values for each of the 8 climate zones are then taken as the averages of the cities in that climate zone. Once climate zone values are determined, it is possible to weight the results based on the fraction of new home starts in each climate zone (Drumheller 2012). Table 9 presents the summary of findings calculated in this manner.

| Table 9. Summary of Life-Cycle-Cost Anarysis Results | | | | | | | | | |

Table 9: Summary of Life-Cycle-Cost Analysis Results

Table 9 shows that climate zone 2 has the smallest SIR and climate zone 8 has the largest. The simple averages tend to over predict the weighted life-cycle savings due to the large savings in climate zone 8, which makes up only on half of one percent of new starts. It is also interesting to note that the NPV of improvements is greater than the 1st cost of improvements in all climate zones.

³ <u>http://www.eia.gov/</u>

Appendix B provides detailed energy use, energy cost, improvement costs and economic cost effectiveness results for each building configuration for each of the 16 TMY sites evaluated by this study.

Conclusions

This study evaluates the cost effectiveness of meeting a stringent future-year code level of home energy efficiency using equipment widely enough available that its current costs can be determined. However, this equipment is not prevalent enough to state with certainty that the estimated incremental cost estimated by this study will not decline significantly as the market develops. Homes that currently meet this level of energy efficiency may be estimated at about 6% of the market by assuming that the 12.4% reported by the RESNET National Building Registry (Martin 2014) constitute less than half of the new home sales and that the remainder do not have a significant number of homes at this level of energy efficiency, otherwise they likely also would have been energy rated.

Costs are virtually certain to come down as the code encourages more builders to buy components that reach lower ERI scores. This is the case because when implemented, appliance efficiency standards (including those for heating, cooling and water heating equipment) actually end up costing much less than predicted using methodologies similar to those used in this study – so much less that a simple arithmetic average shows negative first costs overall (Nadel and deLaski 2012). This likely cost reduction applies to the heating, cooling and water heating equipment cost estimates used for this study.

In summary, the study shows that the ERI scores given by the 2015 IECC are cost effective even when worst-case pricing scenarios are used.

Appendix A Economic Cost Effectiveness

If analyses are conducted to evaluate energy saving improvements to the home, indicators of economic cost effectiveness shall use present value life-cycle costs and benefits, which shall be calculated as follows:

| LCC _E = P1 * (1 st Year Energy Costs) | Eq. [1] |
|--|----------------------|
| LCC _I = P2 * (1 st Cost of Improvements) | Eq. [2] |
| where: $LCC_E = Present Value Life-Cycle Cost of Energy$ $LCC_I = Present Value Life-Cycle Cost of Improvements$ P1 = Ratio of Life-Cycle energy costs to the 1st year energy costs P2 = Ratio of Life-Cycle Improvement costs to the first cost of improvements | |
| Present value life-cycle energy cost savings shall be calculated as follows: | |
| $ LCC_{S} = LCC_{E,b} - LCC_{E,i} $ where: $ LCC_{S} = Present Value Life Cycle Energy Cost Savings $ $ LCC_{E,b} = Present Value LCC of energy for baseline home configuration $ $ LCC_{E,i} = Present Value LCC of energy for improved home configuration $ | Eq. [3] |
| Standard economic cost effectiveness indicators shall be calculated as follows: | |
| $SIR = LCC_S / LCC_I$ | Eq. [4] |
| NPV = LCCs - LCCI where: SIR = Present Value Savings to Investment Ratio NPV = Net Present Value of Improvements | Eq. [5] |
| Calculation of P1 and P2. The ratios represented by P1 and P2 shall be calculated i accordance with the following methodology ⁴ : | n |
| $P1 = 1 / (DR - ER) * (1 - ((1 + ER) / (1 + DR))^{nAP})$ | Eq. [6a] |
| or if $DR = ER$ then | |
| P1 = nAP / (1+DR) where: P1 = Ratio of Present Value Life Cycle Energy Costs to the 1 st year Energy Costs DR = Discount Rate | Eq. [6b] s |
| ER = Energy Inflation Rate nAP = number of years in Analysis Period | |
| $P2 = DnPmt + P2_A - P2_B + P2_C + P2_D - P2_E + P2_F$ where: | Eq. [7] |

⁴ Duffie, J.A. and W.A. Beckman, 1980. *Solar Engineering of Thermal Processes*, pp. 398-406, John Wylie & Sons, Inc., New York, NY.

P2 = Ratio of Life Cycle Improvement costs to the first cost of improvements

DnPmt = Mortgage down payment rate

 $P2_A = Mortgage cost parameter$

 $P2_B = Income Tax cost parameter$

 $P2_C$ = Operation & Maintenance cost parameter

 $P2_D = Property tax cost parameter$

 $P2_E = Salvage value cost parameter$

 $P2_F$ = Replacement cost parameter

$P2_A = (1 - DnPmt) * (PWFd / PWFi)$

where:

PWFd = Present Worth Factor for the discount rate = $1/DR*(1-(1/(1+DR)^nAP))$

PWFi = Present Worth Factor for the mortgage rate = $1/MR*(1-(1/(1+MR)^nMP))$

DR = Discount Rate

MR = Mortgage interest Rate

nAP = number of years of the Analysis Period

nMP = number of years of the Mortgage Period

$P2_{B} = (1 - DnPmt) * iTR * (PWdiff * (MR - 1 / PWFi) + PWFd / PWFi)$ Eq. [8b]

where:

iTR = effective income Tax Rate

PWdiff = ratio of the present worth discount rate to present worth mortgage rate

 $= 1 / (DR - MR) * (1 - (((1 + MR) / (1 + DR))^n MP))$

or if DR = MR then = nMP/(1+MR)

P2c = MFrac*PWinf

where:

MFrac = annual O&M costs as a fraction of first cost of improvements

 $PWinf = ratio of present worth discount rate to present worth general inflation rate = 1/(DR-GR)*(1-(((1+GR)/(1+DR))^nAP))$

or if DR = GR then = nAP/(1+DR)GR = General Inflation Rate

P2_D = pTR*AssessRatio*PWinf

where:

pTR = effective property Tax Rate

AssessRatio = Fraction of assessed property value against which pTR is applied (typically 0.80)

$$P2_E = RLF / ((1 + DR)^nAP)$$

where:

RLF = Remaining Life Fraction following the end of the analysis period and

RLF = (nAP/Life) - (Integer (nAP/Life))

A-2

Eq. [8d]

Eq. [8c]

Eq. [8a]

or if Life > nAP RLF = (Life-nAP) / nAP <u>where:</u> Life = useful service life of the improvement(s)

$P2_F = Sum \{1 / ((1 + (DR - GR))^{(Life*i)})\}$ for i=1, nEq. [8f] $\underline{where:}$ $\underline{i = the i^{th} replacement of the improvement}$ $\underline{Life = the expected service life of the improvement}$

Determination of Economic Parameters. Economic parameter values used in the cost effectiveness calculations shall be determined as follows:

General Inflation Rate (GR) shall be the greater of the 5-year and the 10-year Annual Compound Rate (ACR) of change in the Consumer Price Index for Urban Dwellers (CPI-U) as reported by the U.S. Bureau of Labor Statistics, where ACR shall be calculated in accordance with equation [9].

| ACR = ((endVal)/(startVal))^(1.0/((endYr)-(startYr)))-1.0 | Eq. [9] |
|---|---------|
| where: | |
| ACR = Annual Compound Rate of change | |
| endVal = Value of parameter at end of period | |
| startVal = Value of parameter at start of period | |

endYr = Year number at end of period

startYr = Year number at start of period

Discount Rate (**DR**) shall be equal to the General Inflation Rate plus 2%.

Mortgage Interest Rate (MR) shall be the greater of the 5-year and the 10-year average of simple interest rate for fixed rate, 30-year mortgages computed from the Primary Mortgage Market Survey (PMMS) as reported by Freddie Mac.

Down Payment Rate (DnPmt) shall be 10% of 1st cost of improvements.

Energy Inflation Rate (ER) shall be the greater of the 5-year and the 10-year Annual Compound Rate (ACR) of change in the Bureau of Labor Statistics, Table 3A, Housing, Fuels and Utilities, Household Energy Index⁵ as calculated using Equation [9].

Mortgage Period (**nMP**) shall be defaulted to 30 years unless a mortgage finance period is specified by a program or mortgage lender, in which case the specified mortgage period shall be used. The mortgage period used in the cost effectiveness calculation shall be disclosed in reporting results.

⁵ Table 3A from detailed reports listed at <u>http://www.bls.gov/cpi/cpi_dr.htm</u>
